

# Release Note

---

## Frontend Changes

---

### Feature: Hide Cancel Button After First EMR Save

Added support to hide the **Cancel** button on appointments that have had at least one actual user EMR save (not internal saves). This prevents users from accidentally cancelling appointments where clinical data has already been recorded.

#### Behavior:

| Appointment Status     | Condition                                                       | Cancel Button |
|------------------------|-----------------------------------------------------------------|---------------|
| CONFIRMED              | —                                                               | Visible       |
| PENDING_FOR_RESCHEDULE | —                                                               | Visible       |
| CHECKED_IN             | <code>miscJson.hideCancel</code> is <code>false</code> or unset | Visible       |
| CHECKED_IN             | <code>miscJson.hideCancel</code> is <code>true</code>           | Hidden        |

- **AppointmentDetailsCard.tsx** — Cancel button visibility for `CHECKED_IN` appointments now reads `miscJson.hideCancel` instead of `cnId`.
- **appointment-list.tsx** — Same Cancel button visibility update applied to the appointment list view.
- **appointment-response.ts** — Added `miscJson` field (`Record<string, any>`) to the Appointment interface.

---

### Feature: Visit Demographics Stats on Dashboard

Added three new dashboard widgets — **Visit Gender Statistics**, **Visit Nationality Statistics**, and **Visit Age Group Statistics** — showing visit-based demographics breakdowns.

- **New Components** (`components/demographics/`)
  - `VisitGenderStats.tsx` — Pie chart showing male vs female visit counts with percentage labels and gender icons.
  - `VisitNationalityStats.tsx` — Bar chart showing visit counts grouped by patient nationality.
  - `VisitAgeGroupStats.tsx` — Horizontal bar chart showing visits by standard age groups (0-1, 2-18, 19-35, 36-50, 51-65, 65+).
  - `demographics-utils.ts` — Shared `SortBy` type and `calculateDateRange()` utility for date range computation (today, yesterday, this week, this month, last 3/6 months).
- **new-dashboard.tsx** — Added all three new widgets as configurable dashboard sections with sort and full-screen support.

- **usePreferences.ts** — Added permission checks and section visibility logic for the three new visit stats sections (`visit_gender_stats`, `visit_nationality_stats`, `age_group_visit_stats`).
  - **use-permission-by-pageCode.tsx** — Fixed permission lookup to check both `pageId` and `pageCode` fields when resolving page permissions.
  - **statsApiSlice.ts**
    - Changed `getAppointmentStats` query params from `doctorId` to `resourceId + resourceType`.
    - Added `getPatientDemographics` RTK Query endpoint calling `GET /api/v2/appointment/stats/patient-demographics`.
  - **stats.ts** — Added `AppointmentPatientDemographicsStats` interface with `genderWiseAppointmentCount`, `nationalityWiseAppointmentCount`, `ageGroupWiseAppointmentCount`, and `totalAppointments`.
  - **Translations** (`en/translation.json`, `ar/translation.json`) — Added translation keys for `VISIT_GENDER_STATS`, `VISIT_NATIONALITY_STATS`, `VISIT_AGE_GROUP_STATS`.
- 

## Feature: Reusable `useResourceUser` Hook

Extracted resource-user detection logic (role detection, resource ID/type resolution, head nurse handling) into a shared hook, replacing duplicated inline logic across 6 components.

- **useResourceUser.ts** (`hooks/`) — **New file**
  - **appointment-list.tsx** — Replaced inline resource-user detection with `useResourceUser` hook.
  - **appointmentOverview.tsx** — Replaced inline resource-user detection with `useResourceUser` hook.
  - **calendar-header.tsx** — Replaced inline resource-user detection with `useResourceUser` hook; simplified `useMemo` dependencies.
  - **doctor-calendar.tsx** — Replaced inline resource-user detection with `useResourceUser` hook.
  - **order-list.tsx** — Replaced `sessionStorage`-based user parsing and inline resource detection with `useResourceUser` hook.
  - **appointmentPieChart.tsx** — Changed appointment stats query from `doctorId` to `resourceId + resourceType` via `useResourceUser` hook.
- 

## Feature: Patient Allergy Alerts (EMR Service Integration)

Migrated allergy alert banner from patient service to the new EMR-based allergy alerts endpoint.

- **AllergyAlertBanner.tsx** — Switched from `useLazyGetPatientAllergiesByIdQuery` (patient service) to `useLazyGetPatientAllergyAlertsQuery` (EMR service). Updated field mapping from `allergy.name` to `allergy.allergyName`.
- **emrApiSlice.ts** — Added `getPatientAllergyAlerts` RTK Query endpoint calling `GET /api/v2/emr-document/patient/{patientId}/allergy-alerts`. Exported `useGetPatientAllergyAlertsQuery`

and `useLazyGetPatientAllergyAlertsQuery` hooks.

- **emr-response.tsx** — Added `PatientAllergyAlertResponse` interface with `id` (string) and `allergyName` (string).
- 

## Feature: Patient Story Column in Encounters History

Added a **Patient Story** column to the encounters history table, allowing clinicians to see the patient's story alongside other encounter details.

- **EncountersHistory.tsx** — Added `patientStory` column definition between "Chief Complaint" and "Consultation Type" columns. Mapped `appointment.patientStory` to the new column in the data grid row mapping.
- 

## Bug Fix: Stale Template Overwrite in User Note Form

- **user-note-form-dialog.tsx** — Fixed bug where switching between user notes would overwrite the form with stale template data. Form now only resets when `existingTemplate.id` matches the current `noteId`.
- 
- 

# Backend Changes

---

## (EMR SERVICE) Feature: Hide Cancel Button After First EMR Save

- **UpdateAppointment.java** (`external_services/dto/`)
    - Added `miscJson` field (`Map<String, Object>`) to support passing `hideCancel` flag through the appointment update API.
  - **EMRServiceImplV2.java** (`service/impl/`)
    - After the first EMR user save, reads the appointment's existing `miscJson` and sets `hideCancel = true` only if it is not already set.
    - Calls `appointmentService.updateAppointmentValidationFieldsV2()` to persist the updated `miscJson` back to the appointment.
  - **Database Migration**
    - Run migration script:  
`src/main/resources/db/migration/V20260508__add_hideCancel_boolean_misc_json.sql`
    - This script updates `resource_appointment` table, setting `misc_json.hideCancel = true` for all rows where `cn_id` IS NOT NULL (i.e., appointments that already have clinical data linked).
-

# (EMR SERVICE) Feature: Patient Allergy Alerts API

Added a new REST endpoint to retrieve active allergy alerts for a given patient. The endpoint returns deduplicated allergen names, keeping only the latest record's status for each allergen. Only allergies with `ACTIVE` status are returned.

## API Endpoint:

```
GET /api/v2/emr/patient/{patientId}/allergy-alerts
```

**Response:** `List<PatientAllergyAlertResponse>`

| Field                    | Type                | Description          |
|--------------------------|---------------------|----------------------|
| <code>id</code>          | <code>UUID</code>   | Allergy record ID    |
| <code>allergyName</code> | <code>String</code> | Name of the allergen |

- **EMRDocumentController.java** (controller/)
  - Added `GET /patient/{patientId}/allergy-alerts` endpoint that delegates to `EMRServiceV2.getPatientAllergyAlerts()`.
- **PatientAllergyAlertResponse.java** (dto/response/) — **New file**
  - DTO with `id` (`UUID`) and `allergyName` (`String`) fields.
- **AllergiesRepository.java** (repository/)
  - Added `findAllByPatientIdOrderByCreatedDateDesc()` JPQL query to fetch all allergy records for a patient, sorted by `createdDate` descending.
- **EMRServiceV2.java** (service/)
  - Added `getPatientAllergyAlerts(UUID patientId)` method to the service interface.
- **EMRServiceImplV2.java** (service/impl/)
  - Implemented `getPatientAllergyAlerts()`:
    - Fetches all allergies for the patient ordered by `createdDate` DESC.
    - Deduplicates by allergen name — the first occurrence (latest) wins.
    - Filters to only include records with `AllergyStatus.ACTIVE`.
    - Maps results to `PatientAllergyAlertResponse`.

---

# (APPOINTMENT SERVICE) Feature: Patient Demographics Stats Based on Appointment `misc_json`

Refactored the patient demographics stats feature to read gender, nationality, and age directly from the appointment's `misc_json` column instead of making per-patient API calls. This significantly improves performance by eliminating N+1 calls to the patient service.

- **ResourceAppointment.java** — Changed `misc_json` column annotation to use `LONGTEXT` column definition for larger JSON payloads.
  - **ResourceAppointmentRepository.java** — Added two new JPA queries:
    - `findPatientDemographicsJson` — fetches patient demographics from `miscJson` filtered by hospital and date range.
    - `findPatientDemographicsJsonForResource` — same as above, additionally filtered by resource ID/type.
  - **AgeGroupClassifier.java** — Simplified to classify age from an integer value directly, removing the `computeAge` method and `LocalDate/Period` dependency.
  - **ResourceAppointmentServiceImpl.java**:
    - Replaced async `CompletableFuture` patient-service calls with a single-pass aggregation reading from `miscJson`.
    - Added `enrichMiscJsonWithDemographics()` — on appointment creation/update, patient gender, nationality, and age are written into `miscJson`.
    - Added helper methods `getDemographicValue()` and `computeAgeGroup()` for extracting demographics from the JSON map.
- 

## Manual SQL Scripts

The following scripts must be run manually before deployment for the application to work properly:

### (APPOINTMENT SERVICE) Demographics Stats Indexes

- Run migration script:  
`src/main/resources/db/migration/V20250430__add_demographics_stats_indexes.sql`
  - Adds composite index `idx_ra_hospital_utc_start` on `resource_appointment(hospital_id, utc_start_time)`.
  - Adds index `idx_ra_utc_start_time` on `resource_appointment(utc_start_time)`.
  - Adds index `idx_resource_instance_resource_id` on `resource_instance(resource_id)`.
  - Adds index `idx_resource_instance_appointment_id` on `resource_instance(appointment_id)`.

### (APPOINTMENT SERVICE) Demographics Stats — `misc_json` Column Migration & Backfill

- Run migration script:  
`src/main/resources/db/migration/V20260505_modify_misc_json_resource_appointment.sql`

- Alters `resource_appointment.misc_json` and `resource_appointment_aud.misc_json` columns to `LONGTEXT NULL`.
- Backfills existing rows by joining with `patient` table and writing `patientGender`, `patientNationality`, and `patientAge` into `misc_json`.

## (APPOINTMENT SERVICE) Hide Cancel — Backfill Existing Appointments

- Run migration script:  
`src/main/resources/db/migration/V20260508__add_hideCancel_boolean_misc_json.sql`
  - Updates `resource_appointment` table, setting `misc_json.hideCancel = true` for all rows where `cn_id` IS NOT NULL.

## (EMR SERVICE) Prescription Favorites — Add Instruction Column

- Run script: `src/main/resources/scripts/alter_prescription_favorites.sql`
  - Adds `instruction` column (`TEXT`) to both `prescription_favorites` and `prescription_favorites_aud` tables.

## (EMR SERVICE) Template Favorite — Fix Foreign Keys

- Run script: `src/main/resources/scripts/fix_template_favorite_fk.sql`
  - Drops existing foreign key constraints `FK7xbgcrdbkak29o3ow6um4ut0b` and `FKq3it36ups4nxrx3e8g6i0r01v` from `template_favorite` table.
  - Includes a verification query to confirm the foreign keys were removed.
